

Anna Apple Tree

Grow your
own apples!

Malus pumila 'Anna'

- **Use:** Please be sure to read the Home Garden Apples article from UGA at our checkout. There is too much information to print here.
- **Exposure/Soil:** Sunlight, and plenty of it, is a key to increasing fruit production. Pick an area where the trees will be in the sun most or all of the day. The early morning sun is particularly important because it dries the dew from the leaves thereby reducing the incidence of diseases. If the planting site does not get plenty of sun, then you can't expect the best performance from the tree. Well-drained, rich soil. pH of 5.5 to 6.5 necessary.
- **Growth:** Mature height 18-20 ft. Plant at 25 ft apart.
- **Hardiness:** 6-10; Tree.
- **Foliage:** Deciduous.
- **Flower/ Fruit:** Excellent shaped fruit with a blush of red. Ripens mid-June to early July. Spur-type. Generally cross-fertile, which means that the variety is not pollinated by itself, but by a different variety of the same fruit. Three or more varieties are best. Harvest 3rd year. Pollinator Code A
