

# Lucky Bamboo

**This indoor plant grows well on desks and tabletops, making it a fun addition to your office, school, or home. Because lucky bamboo typically grows in water, you can personalize yours by putting it in watertight container you wish; secure the stems in place with marbles, stones, or other materials.**

## ***Draceana sanderiana***

- **Use:** Lucky bamboo is a wonderful gift plant that adds a bold note to indoor decor with its often intricately arranged stems. It's a slow-growing foliage houseplant that's easy to care for in a low- or medium-light spot. You can find lucky bamboo available in an almost endless variety of arrangements, including heart shapes, twists, curls, and more. There's even lore about how many stems are in the arrangements!
- **Exposure/Soil:** Grow in low or medium light for best results. It can take a high-light spot, but lucky bamboo doesn't like direct sun so it's best to protect it with a sheer curtain to diffuse the light. You'll often see lucky bamboo sold without soil. The stems may be submerged in water and pebbles, gravel, marbles, or even colorful gels. Lucky bamboo is happiest when you keep the stems submerged. Some people like to use rain water to reduce the chemical content in the water, but for the most part, this plant grows just fine in regular tap water.
- **Growth:** Can grow up to 5 feet tall in its natural habitat, but indoors, it is typically kept much smaller, often reaching 3-4 feet. Indoor plants are usually kept at a manageable size with regular trimming to maintain their desired shape and to prevent the stems from becoming unsteady from the weight of new growth.
- **Hardiness:** Zone 10-12 Houseplant /Tropical Will not tolerate below 50 degrees at nite.
- **Foliage:** not intended for human or animal consumption.
- **Flower:** Small white flowers in clusters. Rarely blooms as a house plant.
