

Frost Peperomia

This plant filters pollutants from the air while releasing oxygen. With this plant in your home, you breathe cleaner air.

This plant is considered non-toxic, therefore safe around children and pets.

Peperomia caperata 'Frost'

- **Use:** This low-maintenance indoor plant is compact, drought-tolerant, and about as adorable as a fluffy cloud. Peperomia is a large genus of mostly small, epiphytic plants that grow on rotting wood in tropical & subtropical regions of the world! Most Peperomia have thick stems, fleshy leaves, & very thin, fibrous roots. Peperomias are some of the most popular houseplants due to their ease of care and very wide variety.
- **Exposure/Soil:** Thrives in bright, indirect sunlight. Although most types of peperomia thrive in bright light, too much light fades the bright colors of the variegated foliage. Indoors, a window with an eastern exposure provides excellent light. Prefers humid conditions but is prone to stem rot in soggy soil. Water the plant deeply when the top of the soil feels slightly dry. Let the pot drain completely and never allow the plant to stand in water. Drainage is critical, so make sure the container has a drainage hole in the bottom.
- **Growth:** Grows to be approximately 6-12" inches tall and wide with a slow growth rate.
- **Hardiness:** Zone 10-12, Annual, Houseplant;
- **Foliage:** Frosty leaves add a chill effect to your home.
- **Flower:** Like other Peperomias, produces unscented bloom spikes with many tiny flower blossoms along the spike. The flowers have no petals and are not visible to the unaided eye.
